## **Challenging the Status Quo: Mechanistic and Human-Relevant Screening for Cardiovascular Liabilities**

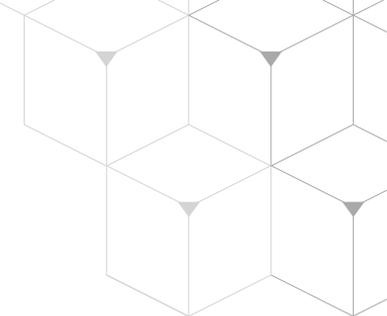

B. R. Berridge  
Cardiac Safety Technical Committee

# Outline

- ▶ Rationale for a novel approach
- ▶ Aims and value proposition
- ▶ Enablers
- ▶ Strategic approach
- ▶ Opportunities

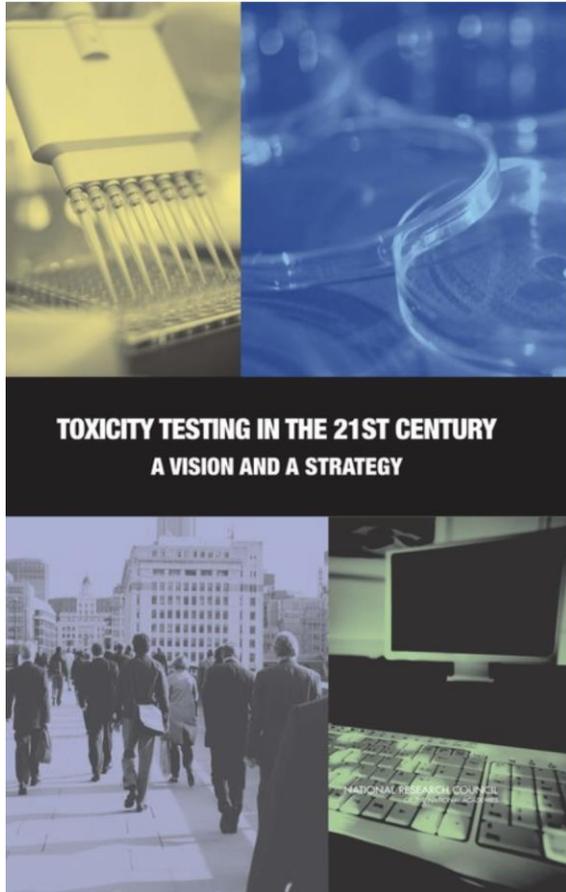

# Rationale

- ▶ Drug development attrition is a significant challenge
- ▶ Safety-related attrition is a significant contributor
- ▶ Cardiovascular liabilities identified in animal studies late in development are prominent source of attrition prior to clinical testing
- ▶ Cardiovascular liabilities identified in patients are worse
  - most problematic liabilities are those associated with imbalances in MACE
- ▶ Animal liabilities may or may not be human liabilities
- ▶ Cardiovascular-specific assessments not generally a component of environmental hazard evaluation

# Larger Context

## NRC Committee on Toxicity Testing and Assessment of Environmental Agents

"Toxicity testing is under increasing pressure to meet several competing demands:

- Test **large numbers** of existing chemicals, many of which lack basic toxicity data.
- Test the large number of new chemicals and **novel materials**, such as nanomaterials, introduced into commerce each year.
- Evaluate potential adverse effects with respect to all critical end points and life stages.
- **Minimize animal use.**
- **Reduce the cost and time** required for chemical safety evaluation.
- Acquire detailed **mechanistic** and tissue-dosimetry data needed to assess human risk quantitatively and to aid in regulatory decision-making.

### MOU aims to improve cardiovascular safety of pharmaceuticals

◀ Previous Article

Next Article ▶

*NTP is part of a new interagency research collaboration to foster more novel, human-relevant safety testing methods*

BY CAROL KELLY

Seeking to improve the cardiovascular safety of pharmaceuticals, the National Toxicology Program (NTP) partnered with the nonprofit [Health and Environmental Sciences Institute](#) (HESI) and the Food and Drug Administration (FDA) [Center for Drug Evaluation and Research](#) (CDER) in a new memorandum of understanding (MOU).

#### Who are the partners?

Brief descriptions of the MOU partner organizations and liaisons follow.

# Mission Statement

Contemporary pharmaceutical cardiovascular safety assessment would benefit from an approach that is more efficient in cost and time, mechanistically informative and human relevant. Such an approach would enable earlier recognition of development-limiting liabilities, fewer false positives leading to premature development termination, more relevant biomarkers and decreased late-stage attrition. The HESI Cardiac Safety Technical Committee will work across its working groups and with other stakeholders to design, test and implement such an approach.

# Mission Statement

Aim

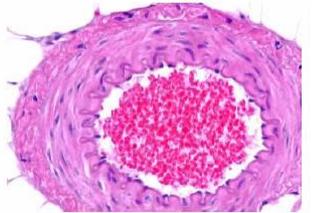

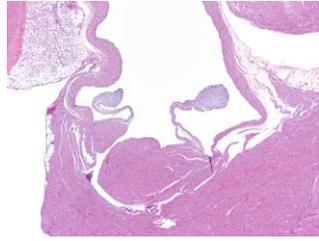

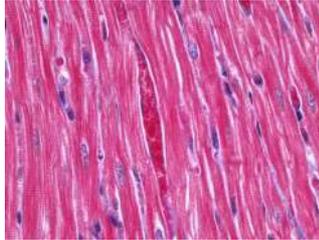

Value proposition

Contemporary pharmaceutical cardiovascular safety assessment would benefit from **an approach that is more efficient in cost and time, mechanistically informative and human relevant.** Such an approach would **enable earlier recognition of development-limiting liabilities, fewer false positives leading to premature development termination, more relevant biomarkers and decreased late-stage attrition.** The HESI Cardiac Safety Technical Committee will work across its working groups and with other stakeholders to design, test and implement such an approach.

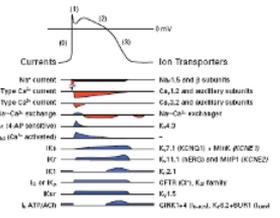

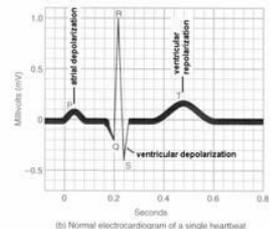

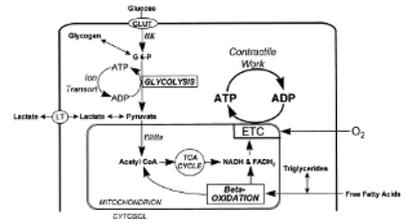

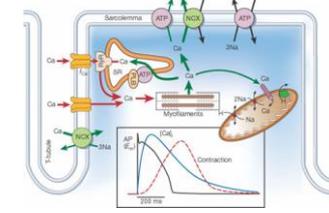

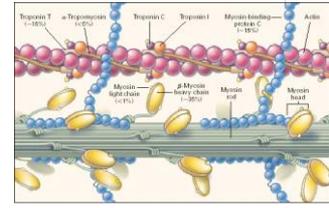

# Key Assumptions

- ▶ There are a finite number of primary responses to CV toxicity- i.e. failure modes (principles of pathology)
- ▶ Behind those failure modes, there are a finite number of key cellular and or molecular 'mechanistic' events (modes of action) that initiate and drive their pathogenesis which are 'screenable' (principles of molecular biology)
- ▶ The likelihood of a xenobiotic inducing a failure mode is a product of it's potency for functionally perturbing a cellular event and the likely *in vivo* exposure in dose and time (principles of toxicology and probability)
  - our confidence in a phenotypic outcome for a mechanistic activity relates to our experience with it- i.e. some activity at a mechanistic level can be directly related to a phenotypic outcome (e.g. 5HT2b agonism) (principles of human behavior)
  - other activities will require phenotypic confirmatory testing (i.e. Tier 2) in more complex biological systems to build confidence in the phenotypic outcome
- ▶ A relevant mechanistic testing strategy should enable clinical risk assessment, progression decisions and the development of clinical monitoring strategies

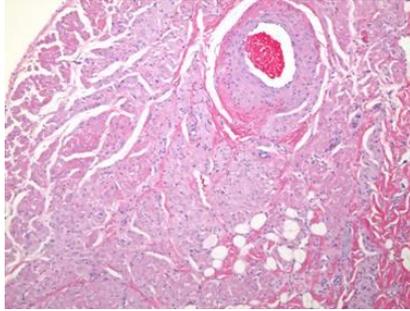

# Enabler: We know what the CV system looks like and how it works!

It's plumbing, electromechanics and energetics!

# Enabler: We understand many control systems!

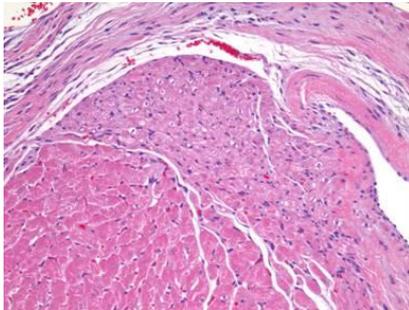

Frank-Starling Law

Natriuretic peptides

- Heart rate (chronotropy) determined by rate of spontaneous SA nodal discharge
- Spontaneous SA nodal discharge determined by balance of autonomic control

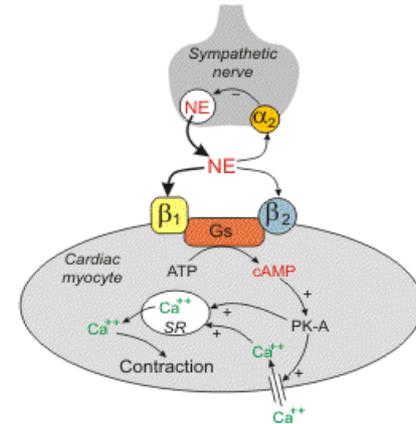

Sympathetic-	norepinephrine	↑ discharge
Parasympathetic-	acetylcholine	↓ discharge

Renin-angiotensin system

NO, Endothelin

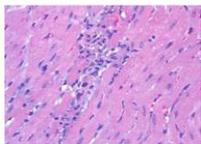

- $\beta$ -adrenergic agonist
  - non-selective for  $\beta_1$ ,  $\beta_2$
  - $\beta_1 = \uparrow$  cardiac inotropy, chronotropy
  - $\beta_2 =$  vasodilation

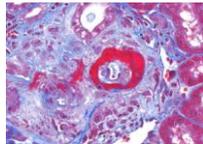

Abbreviations: NE, norepinephrine; Gs, G-stimulatory protein; PK-A, cAMP-dependent protein kinase; SR, sarcoplasmic reticulum

# Enabler: We know what cardiovascular toxicity looks like!

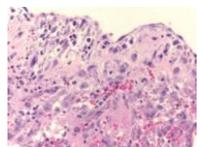

## Structural injuries

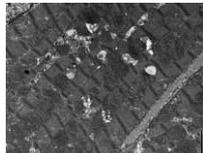

cardiomyocyte injury

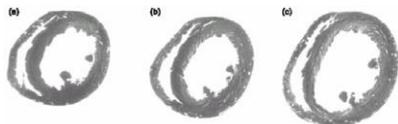

vascular injury

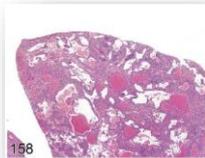

valvulopathy

organellar injury

$\Delta$ cardiac mass

Neoplasia

## Functional changes

Arrhythmia

$\Delta$  BP

$\Delta$  HR

$\Delta$  contractility

## Changes in disease

- Ischemic events
- Coronary artery dz
- Heart failure
- Cerebrovascular events
- Hypertension
- Metabolic disease

 A GUIDE TO DRUG DISCOVERY — OPINION

## Reducing safety-related drug attrition: the use of *in vitro* pharmacological profiling

NATURE REVIEWS | DRUG DISCOVERY | VOLUME 11 | DECEMBER 2012 | 909

Table 1 | Recommended targets to provide an early assessment of the potential hazard of a compound or chemical series

Targets (gene)	Hit rate* Binding	Functional or enzymatic	Main organ class or system	Effects Agonism or activation	Antagonism or inhibition	Refs <sup>‡</sup>
<b>G-protein-coupled receptors</b>						
Adenosine receptor A <sub>2A</sub> ( <i>ADORA2A</i> )	High	Low (agonist)	CVS, CNS	Coronary vasodilation; ↓ in BP and reflex; ↑ in HR; ↓ in platelet aggregation and leukocyte activation; ↓ in locomotor activity; sleep induction	Potential for stimulation of platelet aggregation; ↑ in BP; nervousness (tremor, agitation); arousal; insomnia	57
α <sub>1A</sub> -adrennergic receptor ( <i>ADRA1A</i> )	High	Low (agonist); high (antagonist)	CVS, GI, CNS	Smooth muscle contraction; ↑ in BP; cardiac positive inotropy; potential for arrhythmia; mydriasis; ↓ in insulin release	↓ in smooth muscle tone; orthostatic hypotension and ↑ in HR; dizziness; impact on various aspects of sexual function	58
α <sub>2A</sub> -adrennergic receptor ( <i>ADRA2A</i> )	High	Low (agonist); medium (antagonist)	CVS, CNS	↓ in noradrenaline release and sympathetic neurotransmission; ↓ in BP; ↓ in HR; mydriasis; sedation	↑ in GI motility; ↑ in insulin secretion	59
β <sub>1</sub> -adrennergic receptor ( <i>ADRB1</i> )	Medium	NA	CVS, GI	↑ in HR; ↑ in cardiac contractility; electrolyte disturbances; ↑ in renin release; relaxation of colon and oesophagus; lipolysis	↓ in BP; ↓ in HR; ↓ in CO	60
β <sub>2</sub> -adrennergic receptor ( <i>ADRB2</i> )	High	Medium (agonist); medium (antagonist)	Pulmonary; CVS	↑ in HR; bronchodilation; peripheral vasodilation and skeletal muscle tremor; ↑ in glycogenolysis and glucagon release	↓ in BP	61
Cannabinoid receptor CB <sub>1</sub> ( <i>CNR1</i> )	Medium/high	Medium (antagonist)	CNS	Euphoria and dysphoria; anxiety; memory impairment and poor concentration; analgesia; hypothermia	↑ in weight loss; emesis; depression	62
Cannabinoid receptor CB <sub>2</sub> ( <i>CNR2</i> )	Medium	Medium (agonist)	Immune	Insufficient information	↑ in inflammation; ↓ in bone mass	63
Cholecystokinin A receptor ( <i>CCKAR</i> )	Low/medium	NA	GI	↓ in food intake; gallbladder contraction; pancreatic enzyme secretion; ↑ in GI motility; activation of dopamine-mediated behaviour	↑ in development of gallstones	64
Dopamine receptor D <sub>1</sub> ( <i>DRD1</i> )	Medium/high	Medium (antagonist)	CVS, CNS	Vascular relaxation; ↓ in BP; headaches; dizziness; nausea; natriuresis; abuse potential	Dyskinesia; parkinsonian symptoms (tremor); anti-emetic effects; depression; anxiety; suicidal intent	65
Dopamine receptor D <sub>2</sub> ( <i>DRD2</i> )	Medium/high	Medium/high (antagonist)	CVS, CNS, endocrine	↓ in HR; syncope; hallucinations; confusion; drowsiness; ↑ in sodium excretion; emesis; ↓ in pituitary hormone secretions	Orthostatic hypotension; drowsiness; ↑ in GI motility	66
Endothelin receptor A ( <i>EDNRA</i> )	Low	NA	CVS, development	↑ in BP; aldosterone secretion; osteoblast proliferation	Teraogenicity	67

Are there other targets we should be adding to this primary screen?

Table 1 (cont.) | Recommended targets to provide an early assessment of the potential hazard of a compound or chemical series

Targets (gene)	Hit rate* Binding	Functional or enzymatic	Main organ class or system	Effects Agonism or activation	Antagonism or inhibition	Refs <sup>‡</sup>
<b>G-protein-coupled receptors (cont.)</b>						
Muscarinic acetylcholine receptor M <sub>1</sub> ( <i>CHRM1</i> )	High	Low (agonist); high (antagonist)	CNS, GI, CVS	Proconvulsant; ↑ in gastric acid secretion; hypertension; tachycardia; hyperthermia	↓ in cognitive function; ↓ in gastric acid secretion; blurred vision	73
Muscarinic acetylcholine receptor M <sub>2</sub> ( <i>CHRM2</i> )	High	Low (agonist); medium (antagonist)	CVS	↓ in HR; reflex; ↑ in BP; negative chronotropy and inotropy; ↓ in cardiac conduction (PR interval); ↓ in cardiac action potential duration	Tachycardia; bronchospastic; tremors	74
Muscarinic acetylcholine receptor M <sub>3</sub> ( <i>CHRM3</i> )	High	NA	GI, pulmonary	Bronchoconstriction; ↑ in salivation; GI and urinary smooth muscle constriction	Constipation; blurred vision; pupil dilation; dry mouth	75
5-HT <sub>1A</sub> ( <i>HTR1A</i> )	Medium/high	Low (agonist); medium (antagonist)	CNS, endocrine	↓ in body temperature; reduced REM sleep; ↑ in ACTH; cortisol and growth hormone secretion	Potentially angiogenic	76
5-HT <sub>1B</sub> ( <i>HTR1B</i> )	High	High (agonist); medium (antagonist)	CVS, CNS	Cerebral and coronary artery vasoconstriction; ↑ in BP	↑ in aggression	77
5-HT <sub>1A/2A</sub> ( <i>HTR2A</i> )	Very high	Low/medium (agonist); medium/high (antagonist)	CVS, CNS	Smooth muscle contraction; platelet aggregation; potential memory impairment; hallucinations; schizophrenia; serotonin syndrome	Insufficient information	78
5-HT <sub>2B</sub> ( <i>HTR2B</i> )	High/very high	Low (agonist); high (antagonist)	CVS, pulmonary development	Potential cardiac valvulopathy; pulmonary hypertension	Possible cardiac effects, especially during embryonic development	79
Vasopressin V <sub>1A</sub> receptor ( <i>VPR1A</i> )	Medium	High	Renal, CVS	Water retention in body; ↑ in BP; ↓ in HR; myocardial fibrosis; cardiac hypertrophy; hyponatraemia	Insufficient information	80
<b>Ion channels</b>						
Acetylcholine receptor subunit α1 or α4 ( <i>CHRNA1</i> or <i>CHRNA4</i> )	Medium/high	Low (opener); very high (blocker)	CNS, CVS, GI, pulmonary	Paralysis; analgesia; ↑ in HR; palpitations; nausea; abuse potential	Muscle relaxation; constipation; apnoea; ↓ in BP; ↓ in HR	81
Voltage-gated calcium channel subunit α <sub>1C</sub> ( <i>CACNA1C</i> )	NA	Medium/high (blocker)	CVS	Insufficient information	Vascular relaxation; ↓ in BP; ↓ in PR interval; possible shortening of QT interval of ECG	82

# Designing and executing the framework

**Mobilize** experts in CV toxicology and safety assessment

**Map** phenotypic outcomes of CV toxicity (i.e. failure modes) linked to cellular targets and known mechanistic pathogeneses

**Define** a portfolio of potential testing platforms- e.g. binding assays vs. cellular function assays vs. 3D tissues

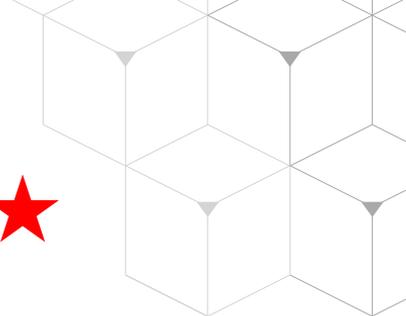

**Crowd source** the development of the needed assays

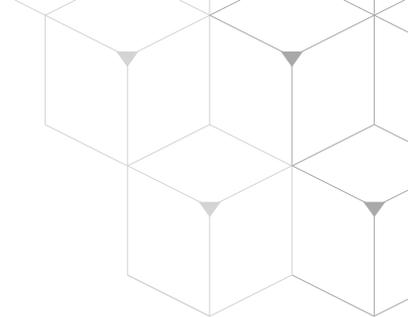

**Validate** the assays and **qualify** the paradigm

**Socialize and launch**

# Salient features of the framework

- ▶ Knowledge-based
  - aligned to what we know about the mechanisms, pathogeneses and phenotypes of CV toxicity
- ▶ Human-relevant
  - systems that reflect human biology at the subcellular, cellular or tissue level
  - testing at in vivo concentrations/exposures
- ▶ Mechanisms
  - goes beyond phenotypic outcomes and probes underlying cellular mechanisms/modes of action
- ▶ Ability to be applied earlier in development than traditional animal studies (e.g. at molecular design rather than candidate profiling)

# Why HESI?

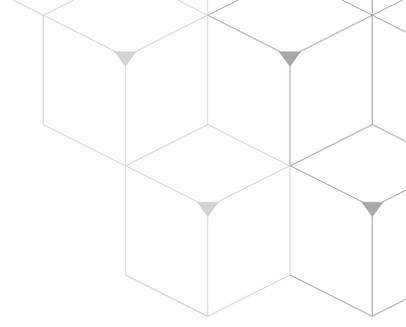

- ▶ It's an existing collaboration of the relevant experts
- ▶ The HESI platform for collaboration facilitates inter-disciplinary and cross-sector partnerships in areas of innovation that uniquely serves all contributors
- ▶ HESI's scientific expertise complements the expertise of the Committee participants
- ▶ HESI's role in supporting the advancement of scientific and collaborative innovation is becoming more and more important in an increasingly noisy and frenetic world

# Opportunities for engagement

- ▶ Current HESI Cardiac Safety Technical Committee is composed of cardiovascular pathobiology and safety experts, CV clinicians, government scientists and modeling platform developers
  - always recruiting new members
- ▶ Crowd sourcing solutions will be an important component of this effort
  - aim = fitting solutions to problems vs. problems to solutions
- ▶ Ultimate success of this initiative predicated on success of partnerships rather than technology
- ▶ Important to involve participants in the full life cycle of CV data to knowledge to decision

# Acknowledgements

- ▶ Norman Stockbridge, Co-Chair HESI Cardiac Safety Technical Committee
- ▶ HESI Staff- Jennifer Pierson, Stan Parish, Cyril Pettit
- ▶ HESI Cardiac Safety Steering Committee
- ▶ HESI Cardiac Safety Committee Members
